

Implement Client Script & UI Policy (Incident)

SCENARIO Creating, validating, updating and saving Incident records	Entice Identify an Incident that needs to be recorded	Enter Open the Incident form and enter required details	Engage Apply validation and conditional field controls	Exit Save/update the Incident with valid information	Extend Maintain consistent data for reporting and service quality
Steps What does the person typically experience?	Recognize an Incident	Open Incident form	Set Impact and enter details	System checks business rules	Save / Update Incident
Interactions What interactions do they have at each step?	User receives or identifies an issue	User opens the Incident record	User enters Impact, Assigned To and details	UI Policy and Client Scripts react to input	User continues using the valid record
Goals & motivations What is the person's primary goal or motivation?	Help me record the issue correctly	Help me enter all needed information	Help me avoid missing or inconsistent data	Help me know when a field is required	Help me save a complete and valid Incident
Positive moments What steps feel productive or helpful?	Clear Incident entry process	Fields respond to Impact conditions	Urgency is set automatically for High Impact	Invalid submission is blocked with an error	Valid records save successfully
Negative moments What steps are frustrating or time-consuming?	Manual checks can be missed	Incomplete data may be entered	High Impact requires additional controls	Missing Assigned To prevents saving	Direct State list editing is blocked
Areas of opportunity How might we make each step better?	Standardize Incident entry rules	Use UI Policies for conditional behavior	Use Client Scripts for automation and validation	Prevent incorrect submission at the UI	Improve data quality, consistency and usability
