

Project Design Phase

Problem – Solution Fit Template

Date	
Team ID	SWTID-2026-5003
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Problem – Solution Fit Template

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem.

Purpose

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase solution adoption by tapping into existing mediums and channels of behavior.
- Sharpen communication and solution strategy with the right triggers and messaging.
- Increase touch-points by finding the right problem-behavior fit and solving frequent or urgent problems.
- Understand the existing situation in order to improve it for the target group.

Template – Filled for the Project

Template Section	Project-Specific Content
1. CUSTOMER SEGMENT(S) (CS)	ServiceNow users and administrators/configurators who create, update, triage, route, and resolve Incident records. The primary users are Incident form users who enter Impact, Assignment group, Assigned To, Urgency, and State information.
2. JOBS-TO-BE-DONE / PROBLEMS (J&P:)	Ensure Incident records contain complete and accurate information; enforce required fields based on Incident conditions; control field behavior dynamically; automatically set Urgency for High Impact incidents; prevent invalid saves; and restrict direct State changes from list editing.
3. TRIGGERS (TR)	An Incident is created or updated, especially when Impact is changed to High, when a user attempts to save an Incident without Assigned To, or when a user attempts to edit State directly from an Incident list.
4. EMOTIONS: BEFORE / AFTER (EM)	Before: users may face incomplete, inconsistent, or incorrect Incident data and uncertainty about required fields or allowed updates. After: users receive clear field behavior and validation, while Incident records are submitted with more complete and consistent information.
5. AVAILABLE SOLUTIONS (AS)	Manual checks and user awareness can be used to verify Incident information, but these approaches can allow incomplete or inconsistent entries. The project replaces reliance on manual checking with ServiceNow UI Policies, UI Policy Actions, and Client Scripts for automated interface-level controls.
6. CUSTOMER CONSTRAINTS (CC)	Incident users may enter incomplete information, rely on manual checks, or attempt changes through different interfaces. The solution must work directly within the ServiceNow Incident form/list interface and apply conditional rules without requiring separate external processes.
7. BEHAVIOUR (BE)	Users enter and update Incident information through forms and lists. They change Impact, assign users/groups, save records, and may attempt direct list edits. The configured solution responds to these actions with mandatory-field enforcement, read-only behavior, automatic Urgency updates, save validation, and list-edit blocking.
8. CHANNELS OF BEHAVIOUR (CH)	8.1 ONLINE: ServiceNow Incident form and Incident list interface. 8.2 OFFLINE: Not specified in the source project document; the implementation is focused on ServiceNow interface interactions.
9. PROBLEM ROOT CAUSE (RC)	Relying solely on user awareness and manual checks can result in incomplete, inconsistent, or incorrect data being submitted. Without interface-level rules, required fields and conditional field behavior may not be consistently enforced.
10. YOUR SOLUTION (SL)	Implement ServiceNow UI Policies, UI Policy Actions, and Client Scripts on the Incident table. The solution makes Assignment group mandatory for High Impact through a UI Policy, makes Urgency read-only under the High Impact condition, automatically sets Urgency to High through an onChange Client Script, prevents saving a High Impact Incident when Assigned To is empty through an onSubmit Client Script, and blocks direct State changes through list editing using an onCellEdit Client Script. Testing verifies mandatory enforcement, successful save, reverse conditions, list-edit blocking, and form-based State updates.
