

Project Design Phase

Proposed Solution Template

Date	03 October 2026
Team ID	SWTID-2026-5003
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	2 Marks

Proposed Solution Template

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Incident records often require consistent and accurate data entry for effective triage, routing, and resolution. Relying only on user awareness and manual checks can lead to incomplete, inconsistent, or incorrect data being submitted. This can affect reporting accuracy, SLA compliance, and overall service quality. The project addresses this by enforcing conditional field behavior and validation directly at the ServiceNow user-interface level.
2	Idea / Solution description	The proposed solution uses ServiceNow UI Policies, UI Policy Actions, and Client Scripts on the Incident table. The UI Policy makes Assignment group mandatory when Impact is High and reverses the behavior when the condition is false. A UI Policy Action makes Urgency read-only for High Impact incidents. An onChange Client Script automatically sets Urgency to High when Impact is High. An onSubmit Client Script prevents saving a High Impact Incident when Assigned To is empty. An onCellEdit Client Script blocks direct State changes through list editing while allowing State updates through the Incident form.
3	Novelty / Uniqueness	The implementation combines multiple client-side controls to enforce different Incident business rules at the interface level. It demonstrates conditional mandatory enforcement, read-only field control, automatic value population, save-time validation, and list-edit restriction using UI Policies and three Client Script types: onChange, onSubmit, and onCellEdit. This provides a lightweight and integrated way to control Incident data entry within ServiceNow.
4	Social Impact / Customer Satisfaction	The solution improves data quality and consistency in Incident records by reducing incomplete or invalid submissions. Users receive immediate field behavior and validation when conditions are met. This supports more reliable Incident triage, routing, reporting, SLA-related processes, and overall service quality.
5	Business Model (Revenue Model)	The source project document does not specify a direct revenue model or monetization mechanism. The implementation is presented as a ServiceNow micro project demonstrating practical configuration and client-side controls for Incident management. Therefore, no specific revenue model is claimed from the source material.
6	Scalability of the Solution	The source describes the solution as lightweight, efficient, and easy to implement for short-duration micro projects. The same pattern of UI Policies, UI Policy Actions, and Client Scripts can be applied to Incident form and list behavior as additional business rules are defined. The source does not provide a quantified scalability limit or deployment scale, so no specific capacity claim is made.
